

WIND ENERGY

Renewable energy means limitless. It is important. After all, since it never runs out unlimited, it is the best energy type to use because it doesn't harm humans or the environment.

Eolic Energy is produced by the wind turning a shaft in the turbines which provides power to a machine called a generator, which produces electricity.

Eolic Energy is when the wind turbines use the wind to spin around and make energy out of it.

Eolic energy is sustainable because generating energy from the wind does not release any carbon emissions. It is also a much better solution than any other non-renewable energy source.
